X Education - Lead Scoring Case Study

Identification of Hot Leads to focus more on them and thus enhancing the conversion ratio for X Education

Group Members:

- Yogini Shewale
- Srisushma Uppalapati
- Smita Nayan

Background

X Education Company

- X Education , An education company named sells online courses to industry professionals
- Many interested professionals land on their website
- The company markets its courses on several websites like Google.
 Once these people land on the website, they might browse the courses or fill up a form for the course or watch some videos

Background

X Education Company

- When these people fill up a form providing their email address or phone number, they are classified to be a lead
- Once these leads are acquired, employees from the sales team start making calls, writing emails, etc. Through this process, some of the leads get converted while most do not
- The typical lead conversion rate at X education is around 30%

Problem Statement

X Education Company's Problem

- X Education gets a lot of leads but its lead conversion rate is very poor
- To make this process more efficient, the company wishes to identify the most potential leads, also known as 'Hot Leads'
- If they successfully identify this set of leads, the lead conversion rate should go up as the sales team will now be focusing more on communicating with the potential leads rather than
 making calls to everyone

Problem Statement

X Education Company's Problem

- We will help them to select the most promising leads, i.e. the leads that are most likely to convert into paying customers.
- We are required to build a model wherein we need to assign a lead score to each of the leads such that the customers with higher lead score have a higher conversion chance
- The CEO, in particular, has given a ballpark of the target lead -conversion rate to be 80%.

Lead – Conversion Process

Lead to Conversion

Lead Generation:

1. Ads on websites like Google

2. Referrals

Visit to X
Education
website by these
potential
customers
(professionals)

Visitors either provide Email id & Contact Details
Or

etc

View videos etc

Tele calling and Emailing activity to all the leads

~30% leads get converted

Proposed Solution:
A model to filter leads
so that leads to
conversion ratio is
80%+

Proposed Solution

Selection of Hot Leads

Leads Clustering

We cluster the leads into certain categories based on their tendency or probability to convert, thus, getting a smaller section of hot leads to focus more on.

Communicating with Hot Leads

Focus Communication

Since we would have a smaller set of leads to have communication with, we might make more impact with effective communication.

Conversion of Hot Leads

Increase conversion

Since we focussed on hot leads, which were more probable to convert, we would have a better conversion rate, and hence we can achieve the 80% target.

Solution

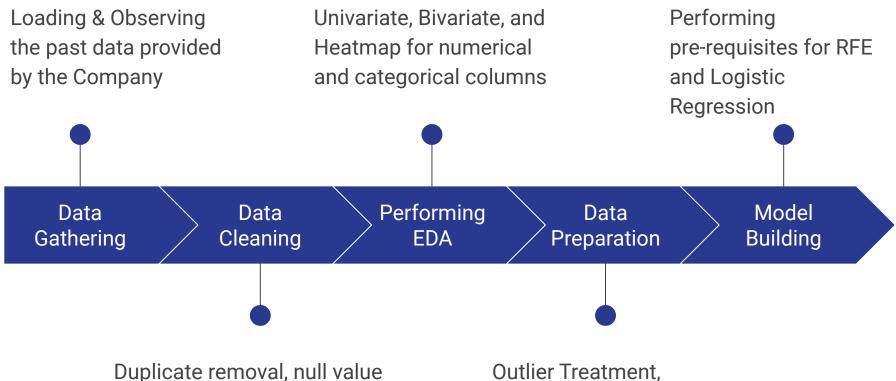

Selection of Hot Leads

For our Problem Solution, the crucial part is to accurately identify hot leads.

The more accurate we obtain the hot lead, the more chance we get of higher conversion ratio.

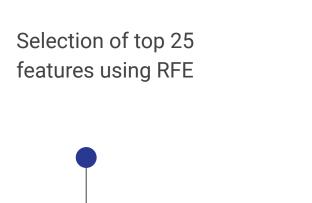

Since we have a target of 80% conversion rate, we would want to obtain a high accuracy in obtaining hot leads.

Implementation

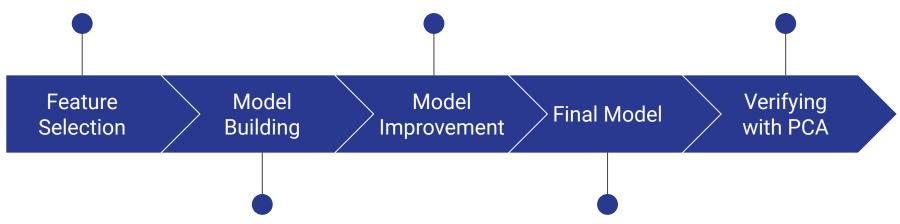

Duplicate removal, null value treatment, unnecessary column elimination, etc.

Outlier Treatment,
Feature-Standardization

Reduction of columns and Model re-building

Verifying our Final Model Accuracy etc. with model built with PCA

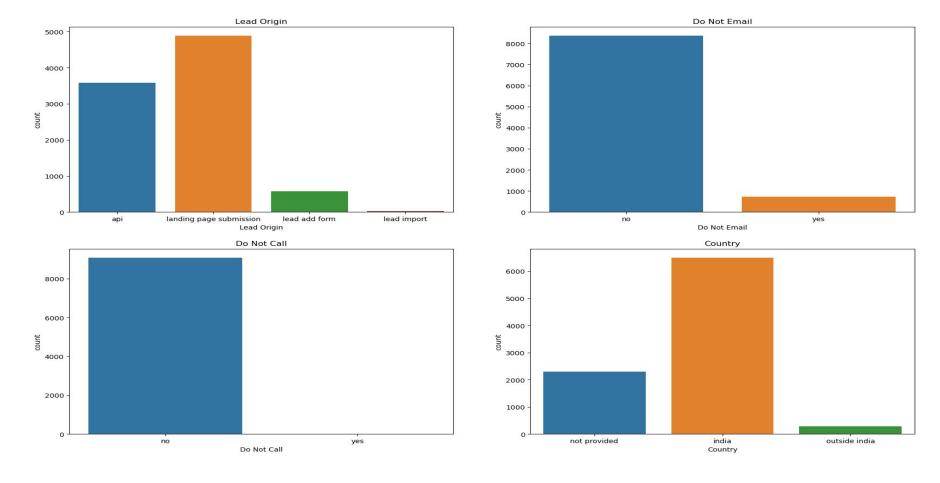

Model building using RFE for selected columns

Final Model Analysis and performance on Test

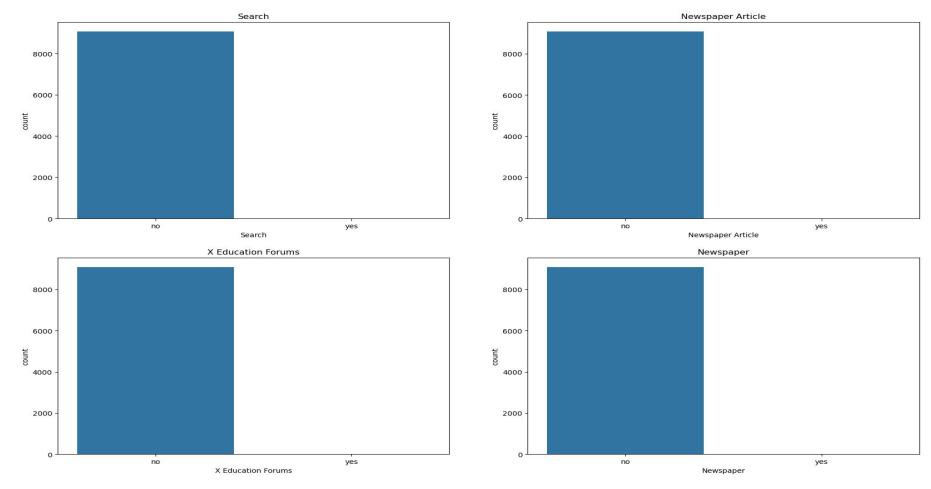

Data

Plots (Visualization)

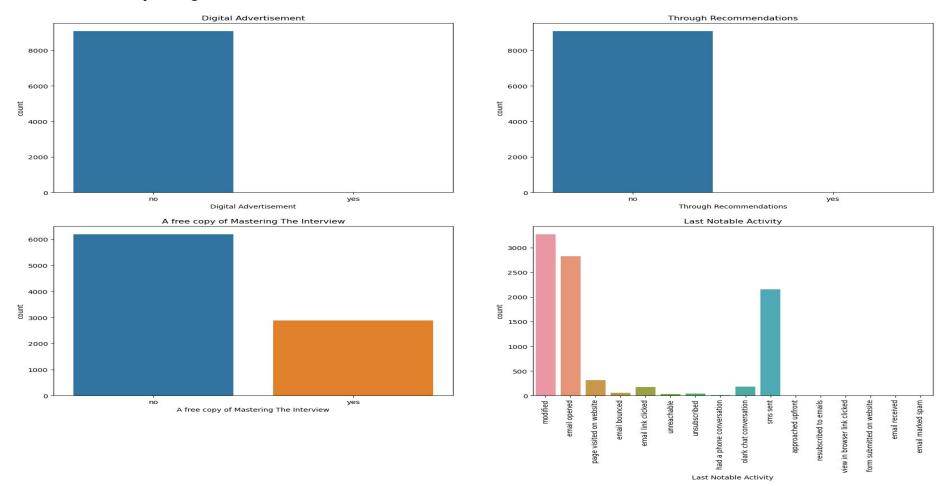

EDA Depicting variation of count based on different Parameters

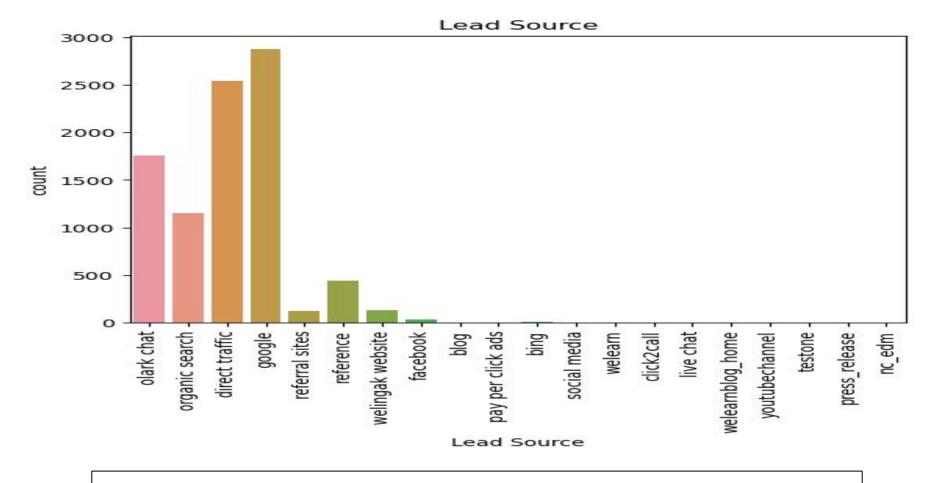

EDA Depicting variation of count based on different Parameters

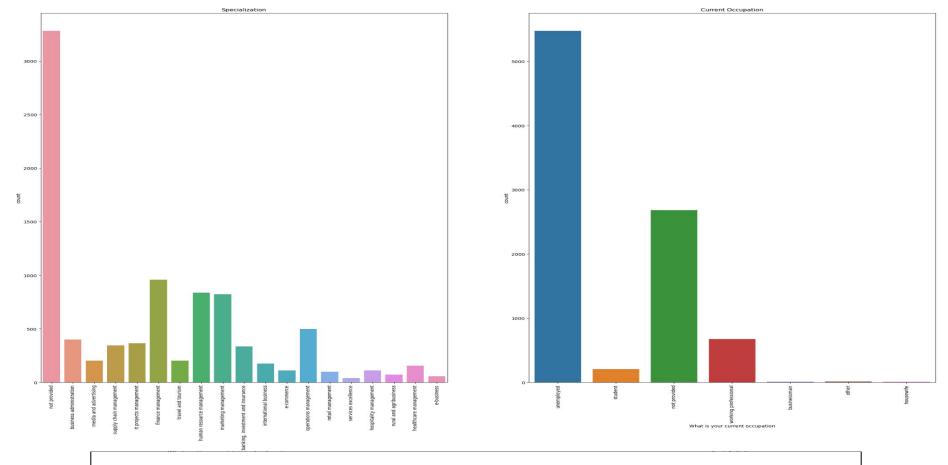

EDA Depicting variation of count based on different Parameters

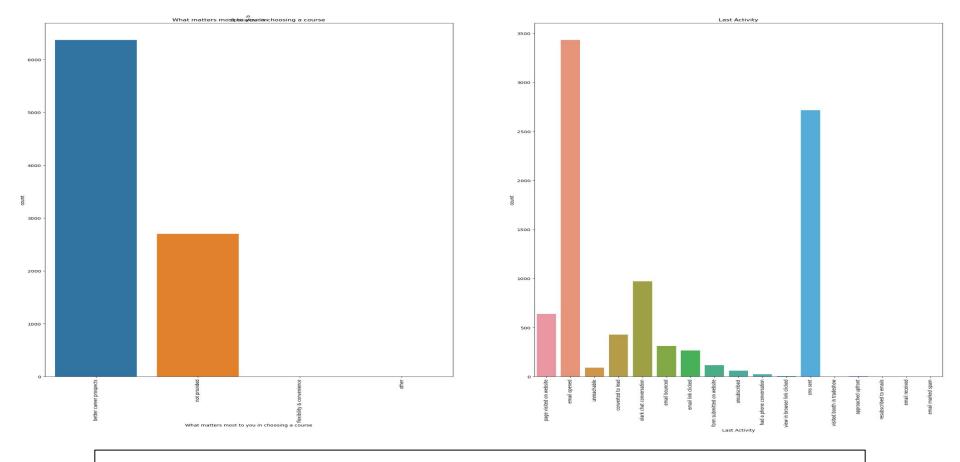

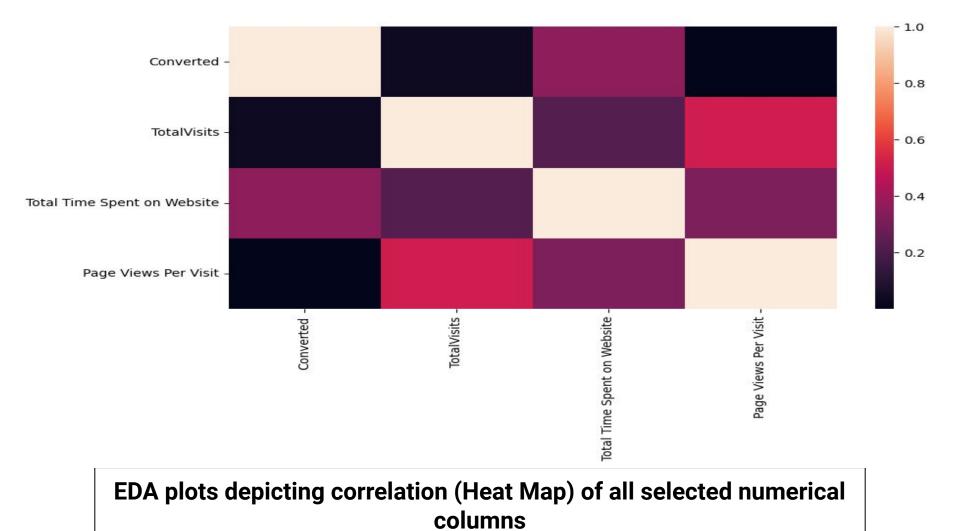

EDA plot depicting variation in count based on Lead Source

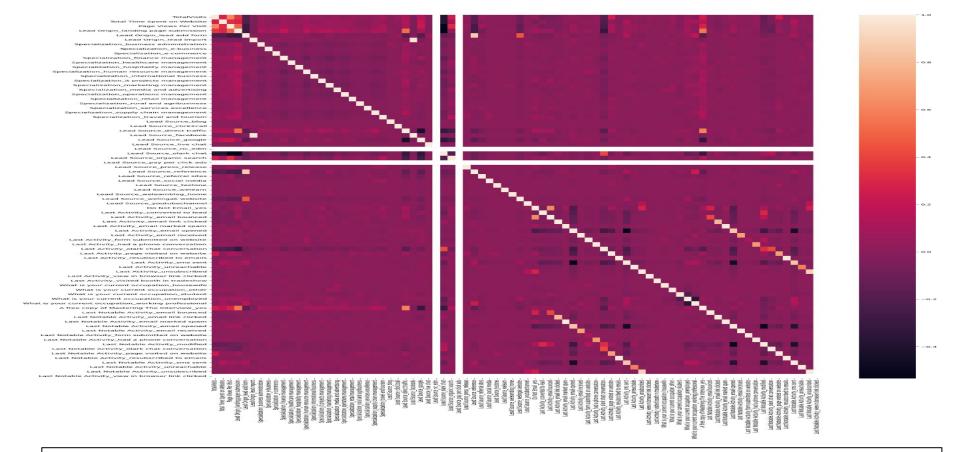

EDA plots depicting variation in count based on "Specialization" and "What is your current occupation".

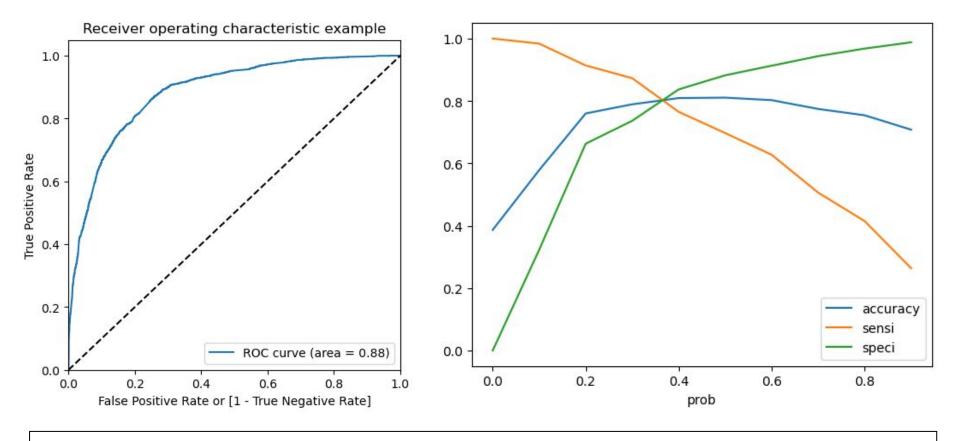

EDA plots depicting variation in count "What matters most to you in choosing a course" and "Last Activity".

EDA plots depicting correlation (Heat Map) of all selected columns (numerical columns and dummy columns).

Linear Regression Final Model Parameters
Area under ROC = 0.89
Intermediate cut-off = 0.35

Inference / Conclusion

Model Analysis

Performance of our Final Model

Overall accuracy on Test set: 0.8035

Sensitivity of our logistic regression model: 0.8037

Specificity of our logistic regression model: 0.8033

Inferences from Model

Business Insights Derived from our Model

Top 3 variables in model, that contribute towards lead conversion are:

- Total Time Spent on Website
- Lead Origin lead add form
- Total Visits

Inferences from Model

Business Insights Derived from our Model

Top 3 variables in my model, that should be focused are:

- Lead Origin_lead add form
- Lead Source_welingak website
- What is your current occupation_working professional

Conclusion 1 (LR Model)

Our Logistic Regression Model is decent and accurate enough, when compared to the model derived using PCA, with 80.35 % Accuracy on Test Set, 80.37 % Sensitivity and 80.33 % Specificity. We can vary these parameters by varying the cut-off value and thus predict Hot leads based on scenarios like availability of extra resources and vice-versa.

Conclusion 2 (Recommendation)

X Education Company needs to focus on following key aspects to improve the overall conversion rate:

- Increase user engagement on their website since this helps in higher conversion
- Increase on sending SMS notifications since this helps in higher conversion
- Get Total visits increased by advertising etc. since this helps in higher conversion
